

From My Shop Battery Spacer Board by Phil Lawrence

This month I want to show a very simple piece to make for those of you who have one of those fancy Model T's with electrical starting equipment. It's a riser board for the battery bracket to raise the battery to its proper height. This wasn't original to Model T's but few of us today use Ford's original battery and battery box that came from the factory.

In the photo are all the necessary measurements to build your own. The material should be a hardwood, such as oak or ash. It would be best to seal the wood with a varnish or similar coating to protect it before installation.
